Lattice problems Why study CVPP?

Concrete applications

- Speeding up lattice enumeration for SVP or CVP [GNR10]
- Solving approximate SVP on ideal lattices [PHS19]
- Computing class group actions in a relation lattice [BKV19]

Commonly a lattice basis (public key) is known long before the target vectors (encryptions, signatures)

Approximate Voronoi cells

Success probability estimation

Main problem: Success probability *p* of the iterative slicer?

Approximate Voronoi cells

Success probability estimation

Main problem: Success probability p of the iterative slicer?

Attempt 1: [DLW19]

- Directly obtained a lower bound on *p* via the slicer
- Conjectured that *p* is exactly proportional to $vol(V)/vol(V_L)$
- Open problem: obtain a tight analysis, perhaps via $vol(V)/vol(V_L)$

Approximate Voronoi cells

Success probability estimation

Main problem: Success probability *p* of the iterative slicer?

Attempt 1: [DLW19]

- Directly obtained a lower bound on *p* via the slicer
- Conjectured that *p* is exactly proportional to $vol(V)/vol(V_L)$
- Open problem: obtain a tight analysis, perhaps via $vol(V)/vol(V_L)$

Attempt 2: [Laa19]

- Proved tight bounds on $vol(V)/vol(V_L)$ under the Gaussian heuristic
- Results show that *p* cannot be (exactly) proportional to $vol(\mathcal{V})/vol(\mathcal{V}_L)$
- From $p \ge \operatorname{vol}(\mathcal{V})/\operatorname{vol}(\mathcal{V}_L)$ we obtain new lower bounds on p
- No nonsensical asymptote at 2^{0.05d} memory anymore

Approximate Voronoi cells

Lower bounds on success probability

Approximate Voronoi cells

Time-space trade-offs for CVPP

Conclusion

Voronoi cells

- Solves CVPP exactly in the worst case for all lattices
- Requires too much space (and time) to be useful

Conclusion

Voronoi cells

- Solves CVPP exactly in the worst case for all lattices
- Requires too much space (and time) to be useful

Approximate Voronoi cells

- Offers heuristic alternative to exact Voronoi cells
- Success probability analysis:
 - Original analysis did not appear to be tight
 - Conjectured that tighter bounds may be obtained via $vol(V)/vol(V_L)$
 - ▶ New results obtained tight bounds on the ratio $vol(V)/vol(V_L)$
 - Resulted in better CVPP complexities for low-memory regime
 - Unfortunately, approach via $vol(V)/vol(V_L)$ is not tight either

Conclusion

Voronoi cells

- Solves CVPP exactly in the worst case for all lattices
- Requires too much space (and time) to be useful

Approximate Voronoi cells

- Offers heuristic alternative to exact Voronoi cells
- Success probability analysis:
 - Original analysis did not appear to be tight
 - Conjectured that tighter bounds may be obtained via $vol(V)/vol(V_L)$
 - ▶ New results obtained tight bounds on the ratio $vol(V)/vol(V_L)$
 - Resulted in better CVPP complexities for low-memory regime
 - ▶ Unfortunately, approach via $vol(V)/vol(V_L)$ is not tight either

Open problems

- Obtain truly tight bounds (ongoing work with Leo Ducas, Wessel van Woerden)
- Find an efficient BDDP-version of this CVPP algorithm
